Virus discovery of CESC and other cancer types

The vast majority of CESC samples are HPV-positive (~92%) having RPHM \geq 100, with 16 different subtypes observed. HPV16 represents 57.6% of HPV positive cases, followed by HPV18 and HPV45, with 12.7% and 7.1%, respectively. HPV31, HPV33, HPV35, HPV39, and HPV52 are 2.4%, 2.4%, 1.6%, 1.6% and 2.4%, respectively (Fig. 1A). High HPV prevalence in CESC is consistent with a meta-study using a PCR-based HPV assay¹ and RNA-Seq data^{2,3}. However, using a complete nucleotide reference database, we were able to further detect several rare HPV subtypes, such as HPV26 and HPV30, which were not reported previously^{1,2,4,5} (Fig. 1A).

Our analysis shows a small fraction of virus-positive samples in other cancer types such as pancreatic adenocarcinoma (PAAD), kidney renal clear cell carcinoma (KIRC), bladder urothelial carcinoma (BLCA), uterine carcinosarcoma (UCS), lung squamous cell carcinoma (LUSC), sarcoma (SARC), skin cutaneous melanoma (SKCM) and brain lower grade glioma (LGG) (Fig. 1A). For instance, in BLCA, we found one sample with BK virus, two samples with HPV16, five with HPV11, HPV45, HPV52, HPV56 or HPV6 and four with HHV5, largely consistent with a previous TCGA report⁶. Levels for BK, HPV16, HPV52, and HPV6 are very high (RPHM $>10^4$) (Fig. S3C). We found three LGG samples with HPV16 and one sample with HPV58. The RPHMs of HPV16 are between 10^2 and 10^3 (Fig. S3D and S9) and E6 and E7 are expressed at higher levels than other viral genes in LGG. In addition, we identified one LUSC and one SKCM with a very high abundance of HHV4 (Fig. 1A and Fig. S3B). The findings of HPV16 on LGG and HHV4 on LUSC and SKCM indicate that HPV16 and HHV4 may play important role in other cancer types.
